Symbifox

Your Odoo calendar, in every app you already use.

Thunderbird, Apple Calendar and Contacts, and Android read and write the Odoo calendar and contacts directly, with no Nextcloud or other relay in between.

Odoo 18 module | Calendar and contacts sync (CalDAV, CardDAV)

symbifox.com | hello@symbifox.com

The reality

What it costs when your calendar lives in two places

Symbifox

Two calendars that disagree

A meeting moved on your phone reaches Odoo late, or never, depending on a relay someone has to keep an eye on.

One reminder, three alarms

Dismissed on your laptop, the same reminder still goes off on your phone, then again in Odoo.

Guests who get every change

Some calendar servers email every guest on the slightest edit, even a snoozed reminder.

Contacts that drift apart

A number fixed on the phone stays wrong in Odoo, and nobody knows which one to trust.

The solution

Odoo becomes the calendar and contacts server for your apps

Symbifox

1

One calendar, everywhere

Change a meeting in Thunderbird, on a Mac or an iPhone, and Odoo has it. And the other way round.

2

Several calendars, own colors

Clients, personal, team: your meetings sorted, in Odoo and on your phone alike.

3

Dismiss a reminder once

Dismissed in Thunderbird, it is dismissed in Odoo and on your Mac too.

4

Only Odoo sends invitations

Your apps send nothing themselves, so nobody gets the same invite twice.

5

Your contacts on your phone

The company address book plus a personal one, both readable and writable.

One password per device

Preferences, Account Security tab

Symbifox

Your password first

Odoo asks for it again before it creates anything.

Shown only once

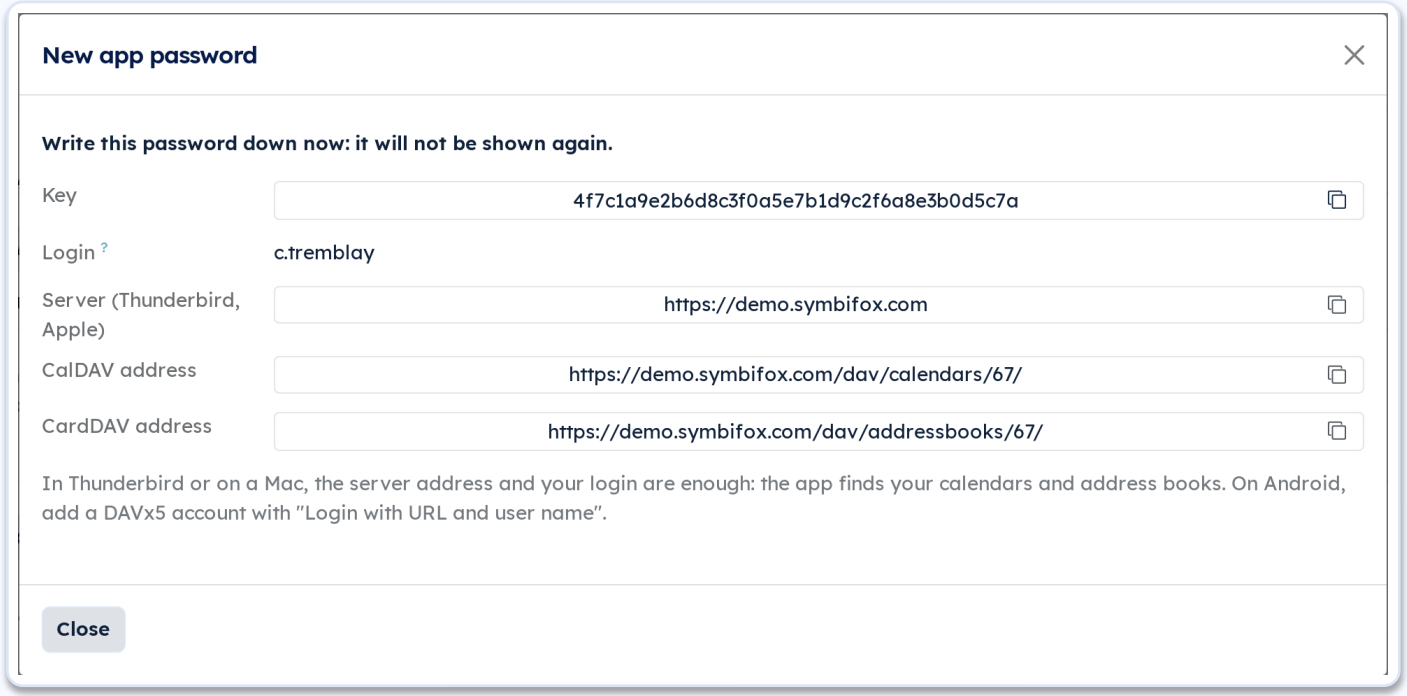

Along with the server address: Thunderbird and Apple find your calendars and address books on their own.

Calendar and contacts only

It opens neither the Odoo login nor its programming access.

Revoked in one step

Cut off a lost device from the list of keys, without touching the others.

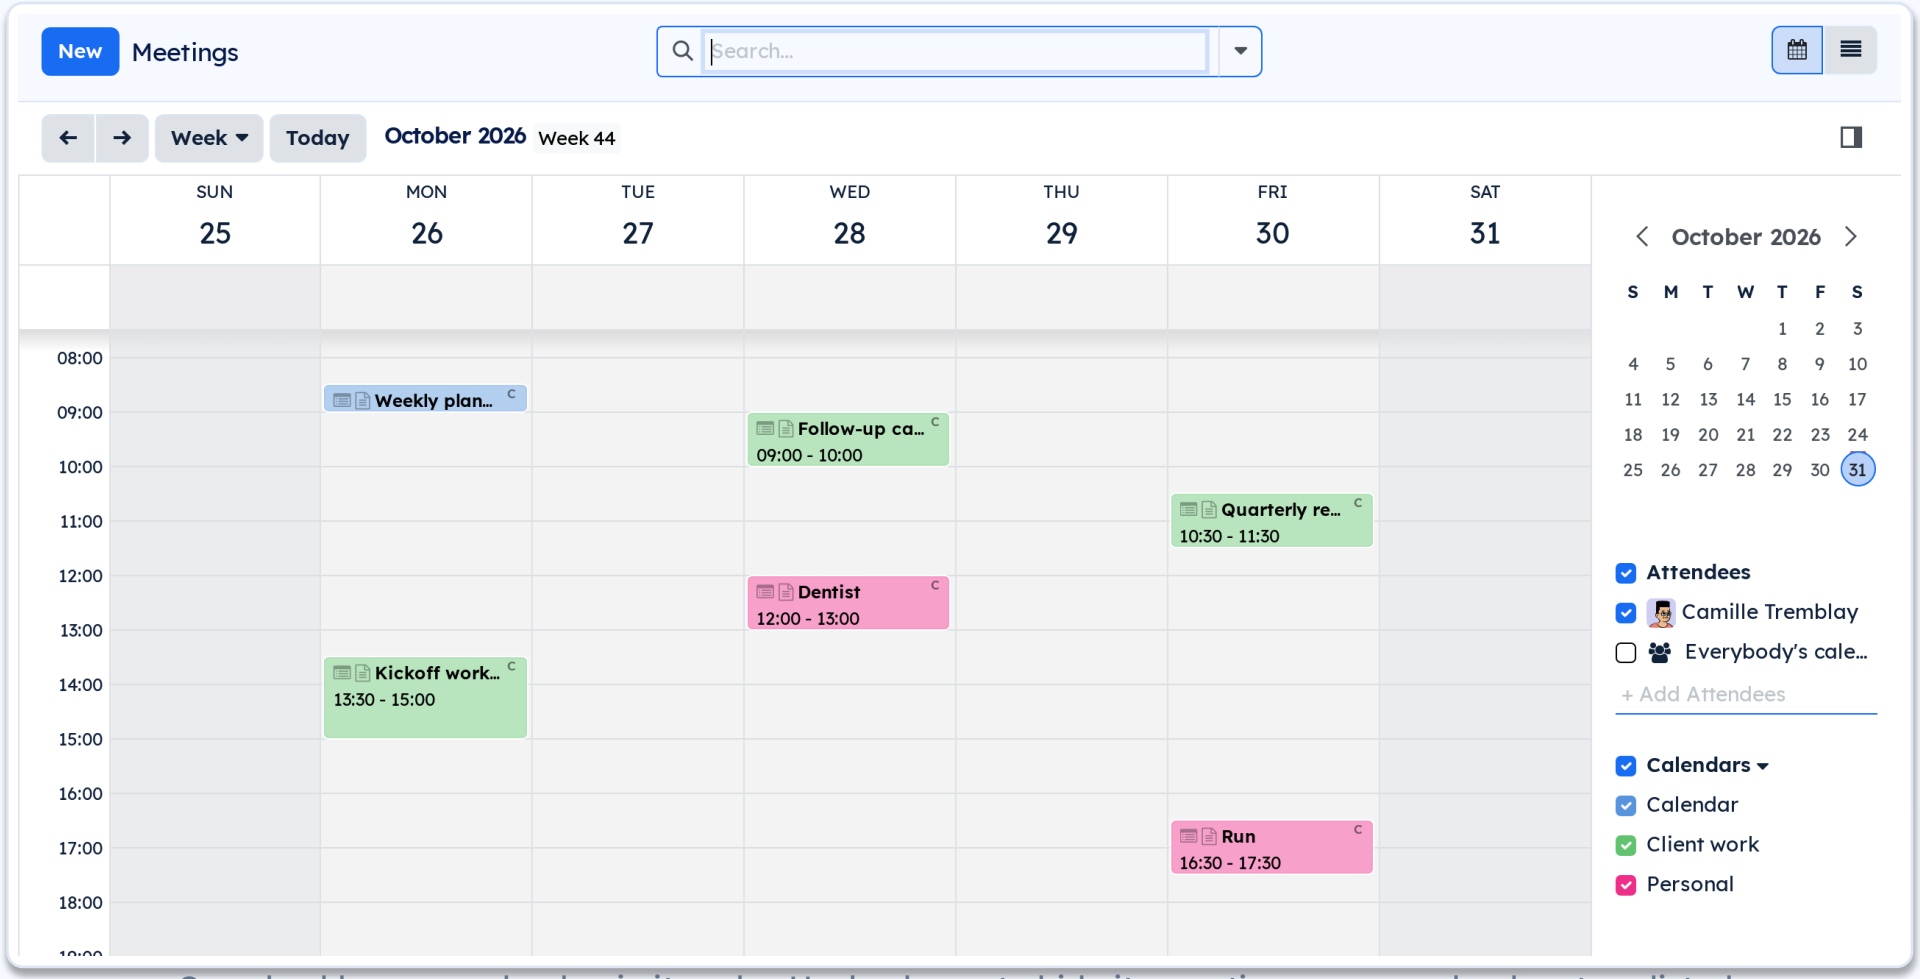

The password in this screenshot is fictitious

Several calendars, each its color

In the Odoo Calendar app, right-hand panel

Symbifox

One checkbox per calendar, in its color. Uncheck one to hide its meetings; every calendar stays listed.

Your calendars, your way

Calendar, Configuration, Calendars for apps

Symbifox

New Calendars for apps

1-23 / 23

Name	Owner	Short address	Default	Color in apps	Color in Odoo	Events
Calendar	Camille Tremblay	calendar	☑			11
Client work	Camille Tremblay	mandats-clients	☐			3
Personal	Camille Tremblay	personnel	☐			2

Name, color offered to apps, color in Odoo, default calendar

Every meeting knows where it lives

On the meeting form

Symbifox

One calendar per meeting

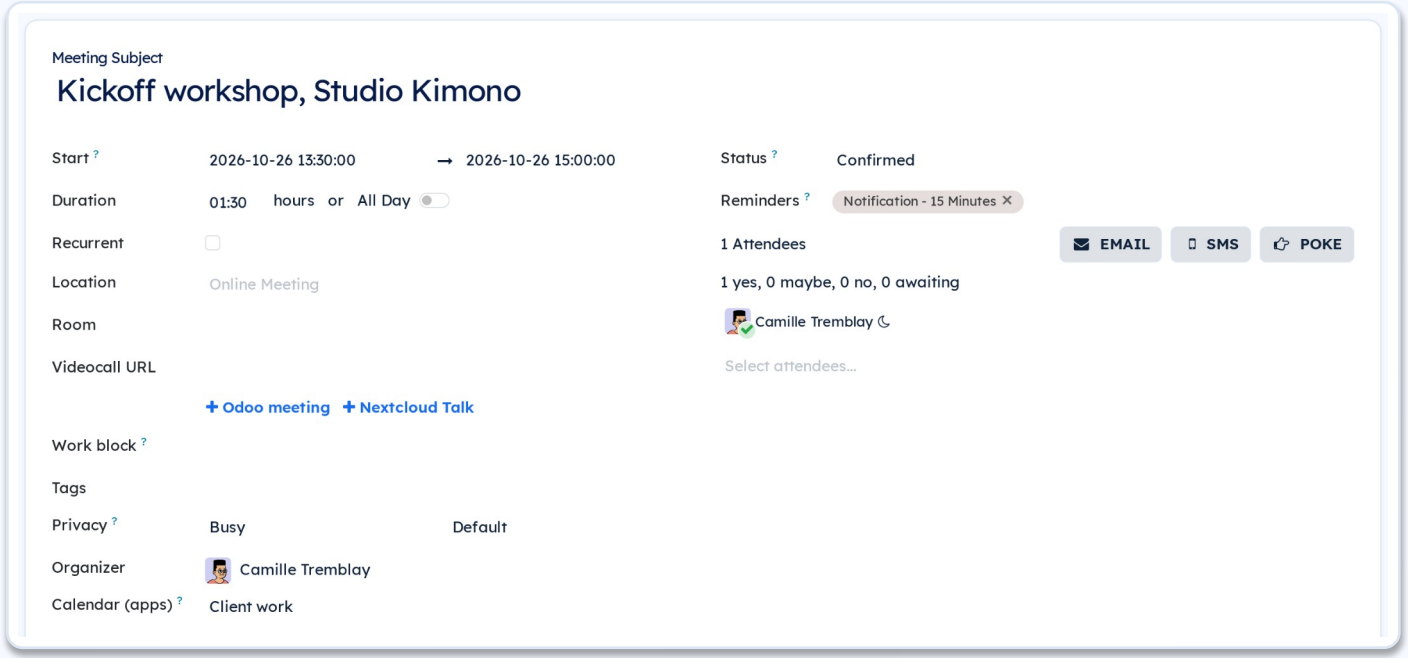

The "Calendar (apps)" field files it, and the meeting takes that calendar's color.

Filed the same everywhere

Thunderbird, your Mac and your phone see the same calendars under the same names.

A default calendar

It receives meetings created in Odoo and those you are invited to.

Fictitious example from the Boréal demo

Dismiss a reminder once

Reminder state follows the person from one app to the next

Symbifox

Seen, snoozed, dismissed

The state travels between Odoo, Thunderbird, Apple and Symbifox Mobile.

For each person

Dismissing your reminder leaves a colleague's reminder for the same meeting alone.

The meeting stays untouched

Changing a reminder's state changes nothing else and emails nobody.

On Android, Symbifox Mobile

The calendar and its reminders go through the app: dismiss on the phone, dismissed everywhere.

Before

You dismiss the 10 a.m. reminder on your laptop. It goes off again on your Mac, then in Odoo, and you dismiss it three times.

With built-in sync

Dismiss it once and it goes quiet everywhere, phone included. The meeting itself does not change.

No guest gets an email because of a reminder.

Only Odoo sends invitations

No duplicate invites, no surprise emails

Symbifox

Your apps stay quiet

Thunderbird and Apple leave the sending to Odoo, so nobody gets two invitations.

A guest added on your phone

Gets Odoo's invitation, exactly as if you had added them in Odoo.

The first sync stays silent

A device that uploads its old meetings in one go emails nobody.

One switch

Invitations triggered from devices can be turned on or off for the whole organization.

A change leaves you a to-do

A meeting moved from a device tells nobody on its own: Odoo leaves you a "Send the update to the guests" activity, due the same day. Deleted from a device, it goes to the calendar trash.

What makes the round trip

Create, edit, delete, on either side

Symbifox

Meetings

- Daily to yearly series
- Moved or cancelled occurrences
- Attendees and their answers
- Privacy
- Busy or free
- Tags and reminders

Contacts

- Company address book
- A personal book per user
- Name, company, contact details
- Tags left out of the book
- Extra details kept for you
- Deleted on a phone: archived

Apps

- Thunderbird
- Calendar and Contacts on Mac
- Calendar and Contacts on iPhone
- Android: DAVx5 and Symbifox Mobile
- Outlook: no, it lacks CalDAV

Who opens what

Narrow access, one device at a time

Symbifox

See the source code

By role

You

Your calendars, those a colleague shares with you, the company book and your own.

A colleague

Sees your private meetings as busy blocks, just as in Odoo.

A device

Its own password, which opens neither Odoo nor its programming access.

Built-in protections

Stale copies refused

An edit based on an outdated version is turned down, never merged behind your back.

Calendar-only access

An app password opens the calendar and contacts, nothing else.

Contacts never destroyed

A contact deleted on a phone is archived in Odoo, not erased.

Nothing half-written

A refused write leaves no trace in Odoo.

Built on the Odoo you have

What you already have, and what this adds

Symbifox

What Odoo already does

- One calendar per person
- Invitations and answers
- On-screen reminders
- Company contacts

What this module adds

- Your calendar in your apps
- Several calendars, own colors
- Shared reminder state
- Contacts on your phone
- A personal book per user
- One password per device

What it does not do

No tasks. A repeat rule Odoo cannot hold, such as "every hour", is refused rather than approximated. Outlook does not speak CalDAV.

What you gain

1. **One calendar, current everywhere**
   Odoo, your computer and your phone show the same thing.
2. **Reminders that go quiet**
   Dismiss a reminder once and it is gone everywhere.
3. **Guests left in peace**
   One invitation, sent by Odoo.
4. **One less server**
   No relay to maintain between Odoo and your apps.
5. **Access cut in one step**
   Revoke a lost device without touching the others.

Shall we connect your Thunderbird together?
