Symbifox

Order right, every single day.

The days each supplier delivers, an order guide that keeps the quantities you typed, and the wholesaler's price file read without retyping it.

Odoo 18 module | Suppliers and orders

symbifox.com | hello@symbifox.com

The reality

What an order decided across three screens costs you

Symbifox

The order guide dies with the screen

A kitchen's is a wizard that disappears when you close it. A store orders all day, aisle by aisle, and comes back to it.

You order blind

On hand, forecast at the delivery after next, what already sits on an unconfirmed request: three screens for one decision.

The wholesaler's file gets retyped

Three hundred price rows arrive as CSV or Excel, and somebody types them. One unit mistake on a case is a factor of twenty-four.

A missing price reads as zero

An expired vendor line shows 0.00 and slips into a total. Absent and free are not the same thing.

The solution

The supplier as it actually delivers, the order as it is actually decided

Symbifox

1

The supplier as it delivers

Its delivery weekdays, the hour to order by, its lead time, its minimum order.

2

An order guide that stays

Built over a day, it keeps every quantity typed and refreshes the facts around them.

3

The facts beside the number

On hand, forecast, already ordered, reordering rule, price, last delivered cost.

4

Odoo's own request for quotation

In the item's purchase unit, for the day this supplier actually delivers.

5

The price file, read

CSV or Excel, whatever its columns, matched on the barcode then the reference.

An order guide that outlives the screen

What it keeps, and what it refreshes around it

Symbifox

Your quantities stay

Typed in the morning, still there in the afternoon, with the facts refreshed around them.

The forecast at the right date

Not today's: the one at the delivery that follows the next.

Already ordered, already seen

What sits on an unconfirmed request does not get ordered a second time.

Rounded to the purchase unit

The suggested quantity rounds up to the unit the item is actually bought in.

What comes back as credit

Over three months, what the supplier took back, so you order less next time.

What each row shows

- On hand
- Forecast at the next delivery but one
- Already ordered, unconfirmed
- Reordering minimum and maximum
- Suggested quantity, rounded
- The supplier's price
- Last delivered cost, and its change
- Credits over three months

The wholesaler's file, read once

Three hundred price rows, matched and dated

Symbifox

Whatever its columns

Its separator, its sheet, its headings: the file is read as it arrives.

Matched in order

Barcode, then internal reference, then the supplier's own code.

A new line, dated from the file

It opens and closes the one before, carrying over minimum, lead time, currency, description.

What was read is what applies

Supplier, attachment and date are frozen as soon as the file is read.

Which column, read as what

Said on the record and on the file: a retail price is never read as a purchase price.

Two broken rows in three hundred

Refusing the lot would stop the store. Every row is kept and counted, and the ones left out say why: price not readable, price of zero or less, row without a code, code with no item, unit to check, the same item twice. On screen, row by row, and on the record.

What it refuses to guess

A doubt named beats a wrong price applied

Symbifox

The unit of a price

Applied in the unit already in place; when the file's label disagrees, the row is left out and named.

Labels read as words

“CASE OF 12 UNITS” holds the word “units” and is still a case. Never a piece of a word.

Both languages of the trade

EA, Each, Un, Unité, CS, Caisse, Doz: compared to the real unit, not to its translated name.

What a number means

“1,250” is 1.25 in French and 1 250 in English: the row is refused, not divided by a thousand.

A format is not a unit

“4 L” describes the item; “12 x 1 L” describes a container, and that one raises a doubt.

Before

The file says 28.80 against a case of twelve. Somebody applies it per unit, and every pot sells below its cost for three weeks.

With the unit check

The row drops out of the lot, named “unit to check”, and the previous price holds until somebody decides.

A case taken for a unit is a factor of twenty-four.

On the demo

The morning order, and the month's price file

Symbifox

The quantity beside what justifies it

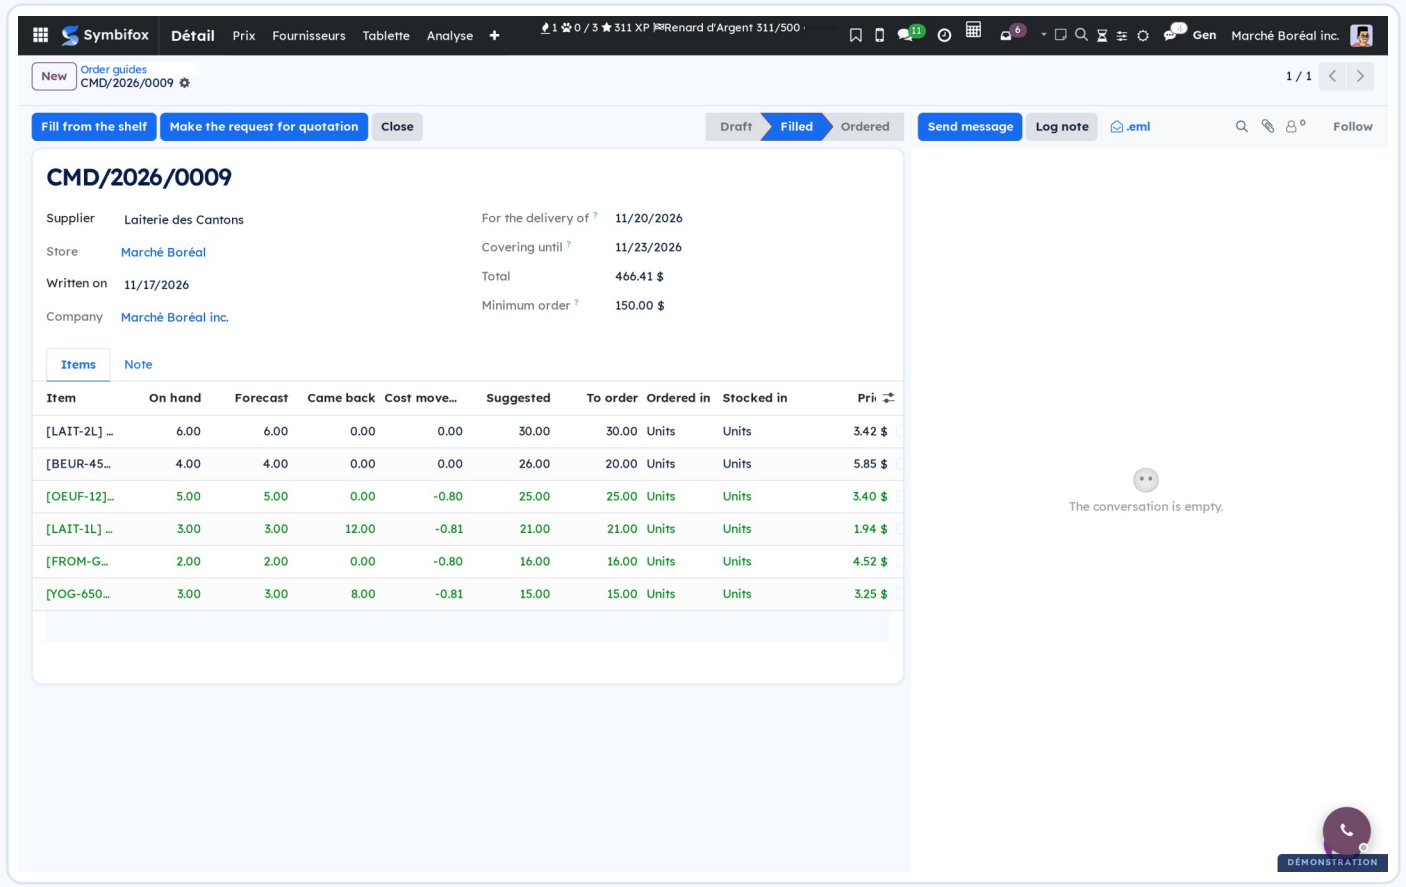

On hand, forecast, returned, the cost that moved: the decision is made on one row.

Your quantities hold all day

Recomputing refreshes the facts and leaves typed quantities where they are.

The file says what it could not read

Columns recognised, rows matched, units to check, repeats: nothing is set aside in silence.

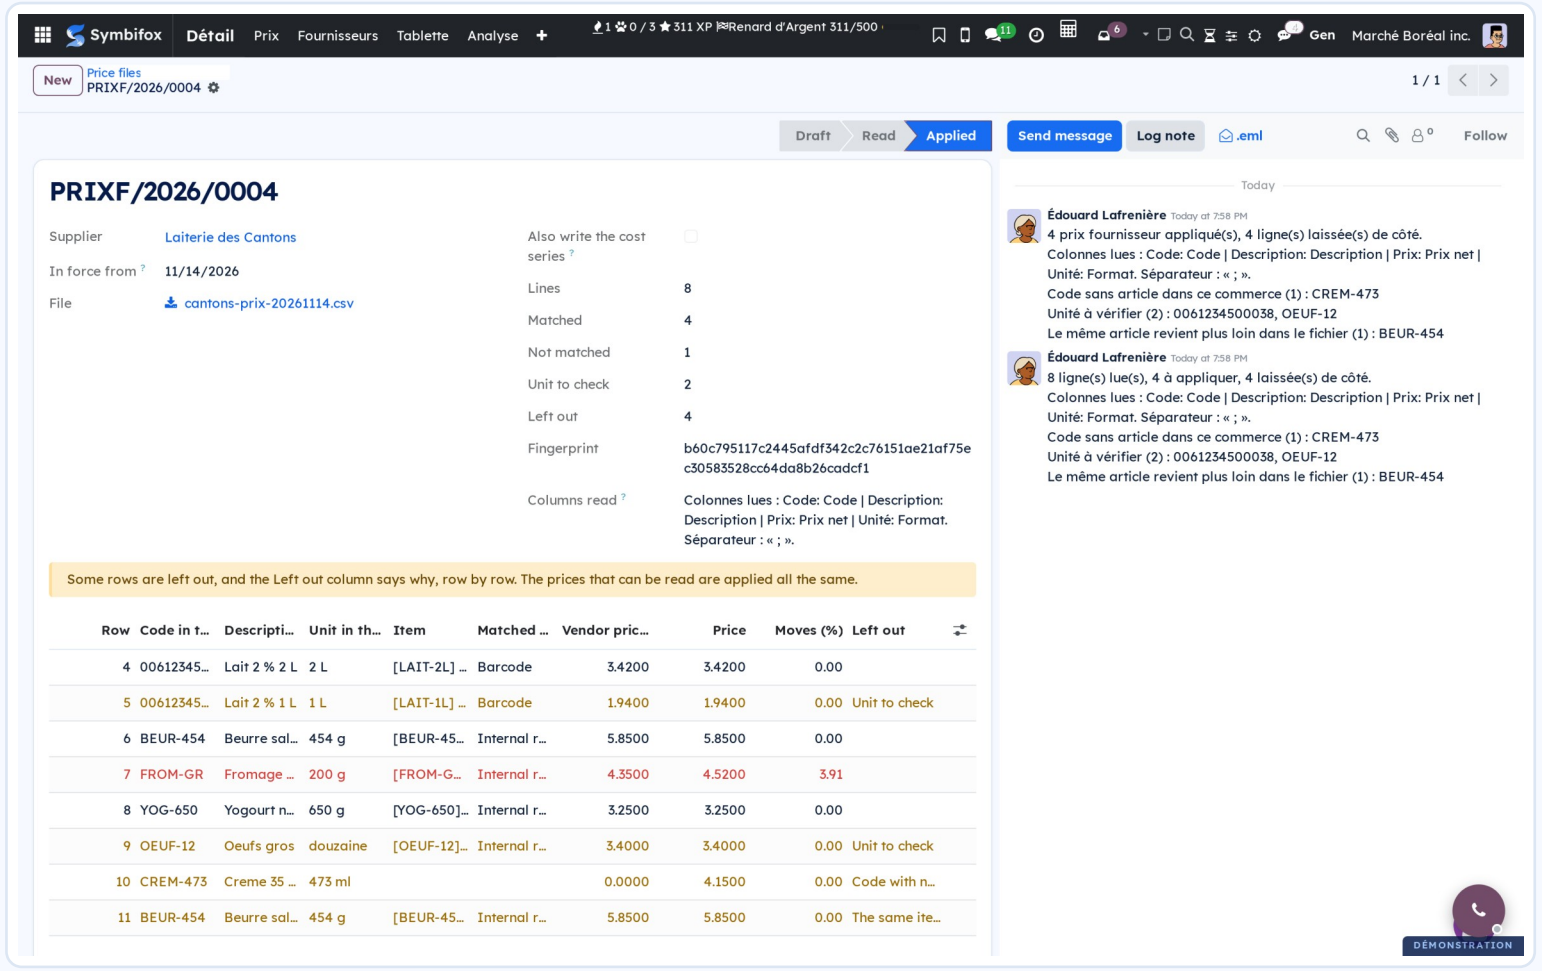

The order guide filled: every fact on the same row

On the demo

The wholesaler's price file, read and applied

Symbifox

The wholesaler's price file, read and applied

What works for you

No setup, no reminder

Symbifox

1	**The delivery day**	The request goes out for the next day this supplier actually delivers.
2	**Noon, where you are**	The hour is set in the store's time zone, not the server's.
3	**The purchase unit**	The quantity is converted into the unit the item is bought in.
4	**The price in force**	An item whose supplier has no valid price is named, not ordered.
5	**The previous line closes**	Each new price opens its line and closes the one before, at the file's date.
6	**Templates wait**	A line set on the model is only closed once the file covers its variants.
7	**Other stores are left**	A line with no company is left as it is, for the other stores.

What Odoo does, and what is missing

Alongside your Odoo, never instead of it

Symbifox

Odoo already does

- Suppliers and their prices
- Requests for quotation and purchases
- Reordering rules
- The stock forecast
- Credit notes

This module adds

- Delivery days and the hour to order by
- An order guide that stays
- The wholesaler's price file
- Return credits per item
- The last delivered cost, and its change

One promise withdrawn, said as such

In Odoo 18 the unit of a vendor line follows the item's own purchase unit, so all its suppliers share it. A supplier that sells in another pack size is modelled by its minimum quantity.

In short

1. **You order with the facts**
   On hand, forecast and already ordered on one row.
2. **The guide outlives the screen**
   Your quantities hold all day long.
3. **The wholesaler's file reads itself**
   Applied row by row, and what drops out says why.
4. **A doubt beats a wrong price**
   An uncertain unit never becomes a factor.
5. **Absent is not free**
   An item with no price in force is named, not ordered.

Bring one wholesaler price file and we read it with you.
