Symbifox

Your course, your brand down to the certificate

The certificate of achievement takes the colours, logo and signature of the course's company, and every certificate can be checked online.

Odoo 18 module | Course certificates

The reality

Three problems with the stock certificate

Symbifox

A software vendor's colours, not yours

The stock document is generic blue with the software's fonts: your training, somebody else's brand.

A number nothing can verify

A sequential number with no page to check it: the employer who receives it can do nothing with it.

The start date, not the pass date

The document shows the day the person began the attempt, not the day they passed.

The solution

Three layouts among your choices, and everything follows

Symbifox

1

The brand of the course's company

Three designs to pick from: panel, minimal, classic. Colours, logo, font and signature of the website's company.

2

The completion date, written out

In the learner's language, in the learner's time zone.

3

A number verifiable online

Random, unguessable, printed with its QR code and its public page.

4

A matching congratulations email

PDF attached, verification link included, off by default: you switch it on course by course.

The certificate, as the learner receives it

Real rendering, fictional data

Symbifox

The signatory's signature

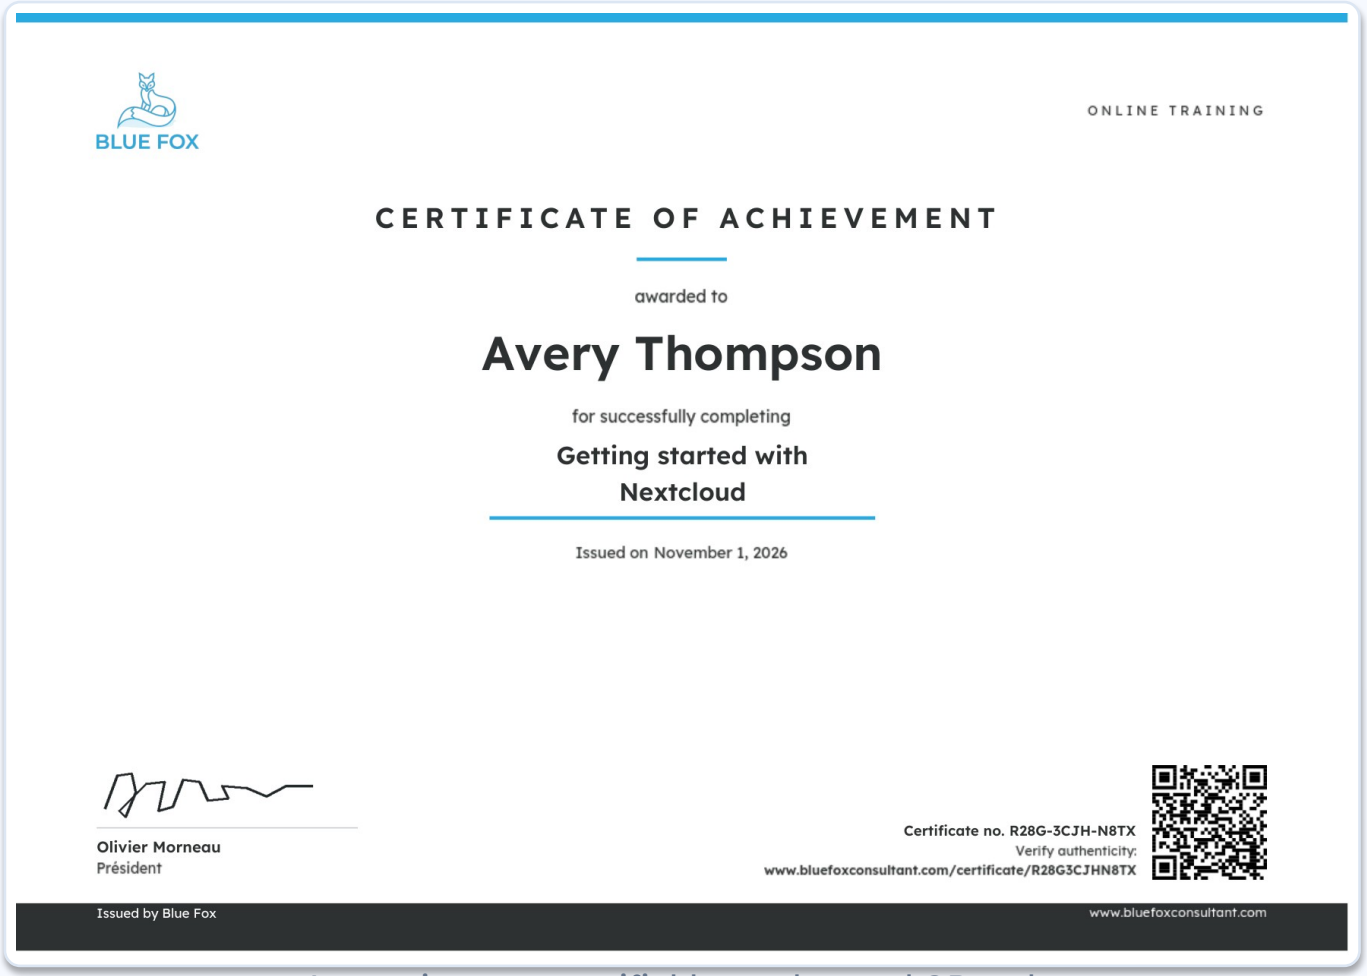

Image, name and title, set once on the company form.

Preferred name, never the legal one

The document shows the name the person goes by.

Long names fit

The layout adapts, from compound first names to long course titles.

Logo, signature, verifiable number and QR code

A number that proves something

Verification with no account and no phone call

Symbifox

Unguessable

Twelve characters drawn at random: billions of billions of combinations.

The QR code leads to the proof

Scanning the document opens its verification page.

A sober page

Name, course, date, issuing company: nothing else, never an email address.

Removal on request

A button on the participation withdraws the number: the page stops answering.

What the employer sees

"This certificate is authentic." The name, the course, the completion date and the issuing company, on your domain.

Complementary to your Odoo

The online courses stay the same; the diploma moves up a class

Symbifox

Odoo alone

- A certificate in the software's colours
- A sequential, uncheckable number
- The date the attempt started
- A generic email, often turned off
- One layout for every company

With this module

- The brand of the course's company
- A random number and its public page
- The completion date, written out
- A branded email matching the chosen design
- Three layouts, picked per course

Restrained by design

The public page gives the proof and nothing else

Symbifox

By role

Visitor

With the number: the confirmation and five facts, nothing more.

Learner

Receives the PDF and the link; can ask for the number's removal.

Staff

Only internal users see the signature image and configure courses.

Built-in protections

Never an email address

The page shows the contact's name, or a masked form.

No enumeration

A wrong or malformed number gets exactly the same answer.

Out of search engines and caches

The page declares itself non-indexable and never cached.

Québec Act 25 assessment done

Minimal disclosure, initiated by the person who hands over the document.

What you gain

1. **A consistent brand down to the diploma**
   Every pass reflects your image, not the software's.
2. **Certificates that stand up**
   An employer verifies in ten seconds, without calling you.
3. **Multi-company with no setup**
   The course website's company decides the brand on its own.
4. **Ready in one checkbox**
   The layout joins your choices; the email goes live when you say so.
