Symbifox

Run the workshop, not three tools at once.

Deck, questions and results on one projected screen. The room answers on their phones, and everything stays inside your Odoo.

Odoo 18 module | Live Session

symbifox.com | hello@symbifox.com

The reality

What a workshop costs when it runs on three tools

Symbifox

The slides know nothing about the questions

The deck lives in one program, the poll in an online service. You switch windows in front of the room, and the thread breaks every time.

The answers go somewhere else

What your team writes during the workshop ends up with a foreign vendor, on their terms, and you retype it afterwards.

Latecomers stay outside

The join code shows on the welcome screen, then disappears. Whoever arrives late asks a neighbour, or gives up.

The wall is blank while the room writes

On an open question or a number, nothing shows while everyone answers. The host narrates an empty screen.

The solution

A workshop run from the survey you already have

Symbifox

1

The deck lives in the survey

A section becomes a slide projected between the questions. Nothing to keep in sync.

2

Four digits to join

A short code and a QR code, on screen from start to finish, no account, no app.

3

The wall shows what lands

Bar chart, word cloud, written answers, leaderboard: every question gets its screen.

4

Teams and a podium

Teams come from a question, and the end puts the top three on blocks.

5

Your colours, your data

Your logo and house colour on screen, the answers in your own instance.

The welcome screen

While the room arrives

Symbifox

A full-screen QR code

Everyone scans it from their seat, picks a nickname, and the counter climbs.

Teams before the start

The strip shows each team and its headcount, so nobody begins without one.

Your brand from second one

Logo and workshop title, over the background you chose.

The QR code, how many people are in, and the teams filling up.

The join code stays up

Because people do not all arrive at the same time

Symbifox

Visible to the end

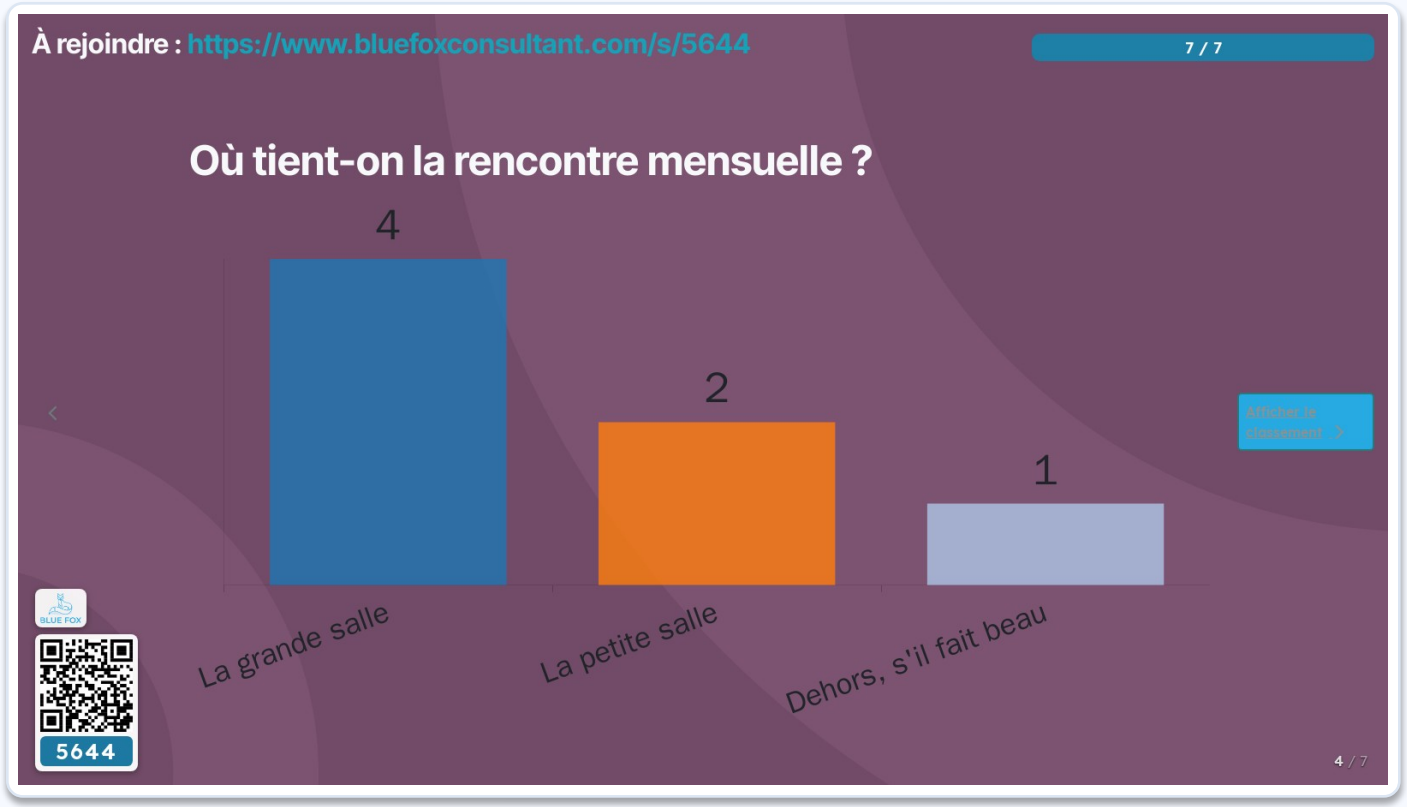

Odoo shows the QR code on the welcome screen and never again. Here it stays, small and readable.

Sized for a projector

The card measures itself as a fraction of the screen, so it never sits on the chart.

It steps aside in time

During the leaderboard and the podium it leaves the frame: that is the end-of-workshop photo.

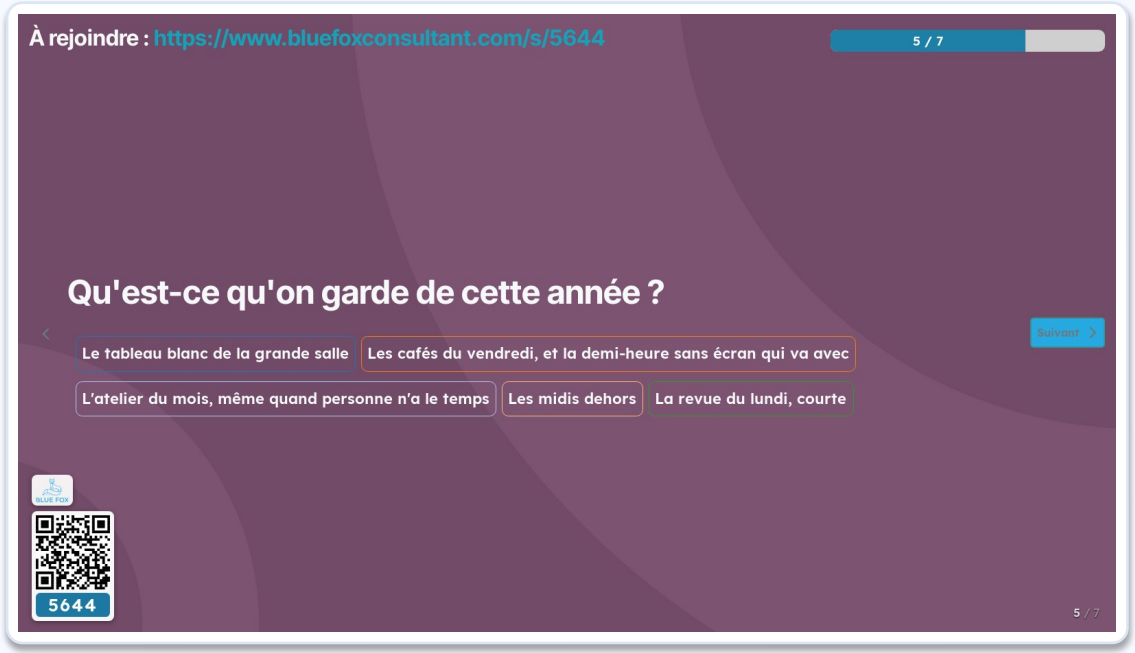

The card bottom left: logo, QR code and session code, for the whole meeting.

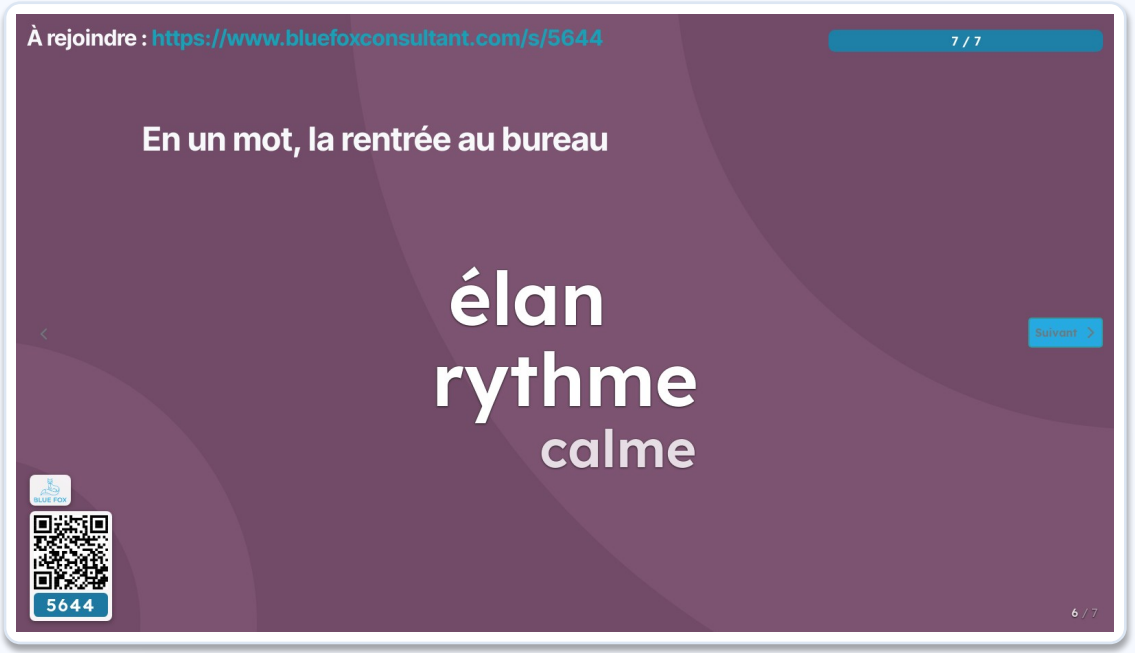

The screens the survey left blank

An open question, a number: the room sees what it writes

Symbifox

Written answers, one per label.

The word cloud, counted on your own server.

The deck, inside the survey

Slides and questions in one thread

Symbifox

Five layouts

Title, text, image, image and text, quotation. A section carries one and projects.

No window to switch

The arrow moves through the deck the way it moves through the questions.

A screen counter

"4 / 7" at the bottom: you always know where you are.

What gets projected

- A title slide
- A text to read together
- A full-width image
- An image and its comment
- A signed quotation
- The survey's questions

The podium

The picture people photograph at the end

Symbifox

By average, not by total

By total the biggest team always wins. That stops being a game.

The total stays on screen

Under the average, so nobody has to do the arithmetic.

Your colours, legible

The three blocks come from your own hue, with ink that reads from the back of the room.

Three blocks in your house colour, ranked by average per member.

Teams

One question is enough to split the room

Symbifox

How they appear

- A choice question creates them
- Answering joins you to one
- One per suggested answer
- Each takes its own colour

What they change

- The leaderboard goes by team
- Average per member decides
- Headcount is on screen
- The podium shows the top three

What is deliberate

- They freeze when the session opens
- An answer added later stays apart
- Team-less people are counted
- Nothing is dropped silently

Complementary to your Odoo

Live sessions already exist: here is what was missing

Symbifox

What Odoo already does

- A session with a short code
- Answers on the phone
- A bar chart per choice question
- A leaderboard of people
- The QR code on the welcome screen

What this module adds

- A slide deck between questions
- The join code on every screen
- A word cloud counted on your server
- Written answers and numbers on the wall
- Teams, a podium, your colours

Nothing is replaced

The module grafts onto Odoo's own screens instead of adding a second set. Your surveys, questions and results stay exactly where they were, and a session run without it behaves as before.

What the room gives

A workshop is not a data collection exercise

Symbifox

By role

The room

Joins with a nickname picked on the spot. No account, no address, nothing to install.

The host

Opens the session and moves through the deck. Survey rights are enough.

Management

Finds the answers in the survey, as with any other questionnaire.

Built-in protections

The answers stay with you

Everything is written to your own Odoo instance. No third-party service receives the workshop content.

The host's test never reaches the wall

A test opened during the session is dropped from every screen, leaderboard included.

A skipped answer is not a zero

Someone who skips a numerical question does not appear on the wall with a zero they never typed.

What you get

1. **One screen to run**
   Deck and questions in the same thread, with no window to switch.
2. **Nobody left at the door**
   The code and its QR stay on screen for the whole session.
3. **The room sees what it writes**
   Word cloud, written answers, numbers: no more blank wall.
4. **An ending worth photographing**
   Teams and podium in your colours, ranked by average.
5. **Your data, your instance**
   What is said in the workshop stays in your Odoo.

Try it on your next team workshop.
