Symbifox

Draw a name in front of the room.

And keep the receipt.

A projected wheel that draws at random, and a register that says who won, when, and out of how many.

Odoo 18 module | Prize Wheel

The reality

What a draw costs when it runs on a free website

Symbifox

The list gets retyped

The names of the people in the room are already in your instance, and yet someone types them again into a window somewhere else.

Nothing survives the draw

The next day, "who has already won?" has no answer, and the second spin sometimes gives back the same name.

Nobody can check

A draw you cannot show is not a draw, it is a claim. When a prize is attached, that gets argued.

The solution

A wheel fed by your own data, that leaves a trail

Symbifox

1

Projected full screen

It spins, slows and stops on a segment. Readable from the back of the room.

2

A register of every draw

The time, who launched it, the name that came out, the candidate count and the total weight.

3

Weighted segments

A segment can count for more than another, and the wheel shows it on screen.

4

No repeats

A wheel can set aside what already came out, so the second spin gives a different name.

The list does not have to be typed

The wheel finds its candidates in your Odoo

Symbifox

The people in a live session

Wired to an open session, it draws among those who have joined, re-read on every spin.

The answers to a question

It can also draw among the answers given, weighted by how many people gave each.

Or segments you write once

When the list exists nowhere, you write it once and it serves every time.

Today's room, not yesterday's

The list is bounded to the session in progress. Whoever arrives between two draws is in the second one, and the people from last month's meeting are never called back by mistake.

What the register keeps

So the draw can be shown, not just retold

Symbifox

Every spin

- The time of the draw
- Who launched it
- The name that came out
- The winning segment's rank

The context

- How many candidates
- The total weight in play
- Where the list came from
- Which wheel was used

What it buys you

- Answering "who won?"
- Re-running a disputed draw
- Avoiding the same person twice
- Showing the method

Readable from the back

The colours are computed, not picked at random

Symbifox

The house palette

Twelve measured hues, each at a lightness where the label reads.

The ink follows the segment

Every label takes whichever ink, light or dark, contrasts most with its background.

A floor that holds

Contrast meets the 4.5:1 accessibility threshold on every segment.

Before

A wheel in colours picked at random, where one segment in three carries a name you guess at rather than read.

With this module

Every segment carries a measured colour and a computed ink: the winning name reads from the back of the room, first time.

What you get

1. **A draw that can be shown**
   Projected large, and written down for afterwards.
2. **No list to retype**
   Candidates come from the session or from the answers.
3. **Never the same name twice**
   Setting aside what came out holds from one spin to the next.
4. **Readable for everyone**
   Colours and inks computed for a projector.

Put it at the end of your next workshop.
